There is a function we are providing in for you in this problem called `square`. It takes one integer and returns the square of that integer value. Write code to assign a variable called `xyz` the value `5*5` (five squared). Use the square function, rather than just multiplying with `*`.

Save & Run   2/3/2021, 10:55:17 PM - 3 of 3   Show CodeLens

```
1 xyz = square(5)
2 print(xyz)
3
4
5
```

Write code to assign the number of *characters* in the string `rv` to a variable `num_chars`.

Save & Run   2/3/2021, 11:02:33 PM - 4 of 4   Show CodeLens

```
1 rv = """Once upon a midnight dreary, while I pondered, weak and weary,
2     Over many a quaint and curious volume of forgotten lore,
```

```
 3      While I nodded, nearly napping, suddenly there came a tapping,
 4      As of some one gently rapping, rapping at my chamber door.
 5      'Tis some visitor, I muttered, tapping at my chamber door;
 6      Only this and nothing more."""
 7
 8 num_chars=len(rv)
 9 print(num_chars)
10
11
```

---

data-19-1: The code below initializes two variables, `z` and `y`. We want to assign the total number of characters in `z` and in `y` to the variable `a`. Which of the following solutions, if any, would be considered hard coding?

Score: 1.0 / 1

Comment: autograded

```
z = "hello world"
y = "welcome!"
```

☑ A. a = len("hello worldwelcome!")

☑ B. a = 11 + 8

☐ C. a = len(z) + len(y)

☑ D. a = len("hello world") + len("welcome!")

☐ E. none of the above are hardcoding.

[Check me] [Compare me]

✔ Correct.
   A. Though we are using the len function here, we are hardcoding what len should return the length of. We are not referencing z or y.
   B. This is hardcoding, we are writing in the value without referencing z or y.
   D. Though we are using the len function here, we are hardcoding what len should return the length of each time we call len. We are not referencing z or y.

(This is not an assessment question) The code below defines functions used by one of the questions above. Do not modify the code, but feel free to take a look.

[Save & Run]   Original - 1 of 1   [Hide Code] [Show CodeLens]

```
2  def square(num):
3      return num**2
4
```
